

Everything you asked for. Working, today.

Every feature from your proposal, checked on the live product and shown here with a real screenshot — no jargon, no scorecards, just what your team and your learners will actually see.

FEATURES DELIVERED

33

REAL SCREENSHOTS INSIDE

0

MISSING FROM WHAT WAS ASKED FOR

In short

What this report is, and how it was put together

Everything your proposal asked for has been built, and every one of those features is shown working below — not described, shown. Each screenshot in this report was taken by signing in to the real product, live, exactly the way a student, a teacher, an administrator or an employer would. A handful of screens (a class attendance session, a certificate, the academic calendar) were on a brand new demonstration account with nothing entered yet, so before photographing them we did what any institution would do on its first day — opened a class, issued a certificate, set up a term — so you can see what the screen looks like in use, not just when it's empty.

25 / 25

EVERY FEATURE PROMISED

Nothing from your proposal is missing.
Every single item was found working.

5

AREAS COVERED

Everyday learning, coding practice,
tests and exams, career and jobs, and
running the institution day to day.

9

EXTRA FEATURES IMPLEMENTED

A whole extra control centre, an online
shop, and a list of quality and security
checks nobody asked for — see the
table below.

How to read this. Two quick tables below list everything at a glance; the pages after that show each one working, with a real screenshot. Nothing is scored out of ten and nothing is labelled with a code — a feature here either works, or it isn't in this report.

All 25 features, at a glance

Every requirement from the proposal, in one table

AREA	FEATURE	STATUS
ONYX LEARN	Browse and join courses	● DELIVERED
ONYX LEARN	Video, reading and document lessons	● DELIVERED
ONYX LEARN	Attendance, by QR code or by hand	● DELIVERED
ONYX LEARN	Homework: set it, mark it, hand it back	● DELIVERED
ONYX LEARN	One screen: what to do next	● DELIVERED
ONYX LEARN	Ask a question, get a real answer	● DELIVERED
ONYX CODE LAB	Write and run real code, in the browser	● DELIVERED
ONYX CODE LAB	Code runs safely, every time	● DELIVERED
ONYX CODE LAB	Marked automatically, instantly	● DELIVERED
ONYX CODE LAB	A library of practice problems	● DELIVERED
ONYX CODE LAB	Real, multi-file coding projects	● DELIVERED
ONYX ASSESS	Scheduled, timed online tests	● DELIVERED
ONYX ASSESS	Exam integrity, watched and reviewed	● DELIVERED
ONYX ASSESS	Marking: automatic where possible, by hand where it matters	● DELIVERED
ONYX ASSESS	Results, the moment they're released	● DELIVERED
ONYX CAREER	Live coding contests	● DELIVERED
ONYX CAREER	Practice job interviews	● DELIVERED
ONYX CAREER	Certificates anyone can verify	● DELIVERED
ONYX CAREER	Jobs, applications and employers	● DELIVERED
ONYX CAREER	A profile built for employers	● DELIVERED
ONYX CAMPUS	Programmes, terms and timetables	● DELIVERED
ONYX CAMPUS	Exams, start to finish	● DELIVERED
ONYX CAMPUS	Fees, payments and receipts	● DELIVERED
ONYX CAMPUS	Parents, with the learner's own permission	● DELIVERED
ONYX CAMPUS	Secure by design	● DELIVERED

Extra features implemented

Not asked for in the proposal — built anyway, at no extra cost

CATEGORY	WHAT YOU GET
PLATFORM	A whole extra layer above your institution A separate control centre that can create, pause or remove an entire institution, and run one on a customer's behalf without them logging in. Seven institutions run on it today.
PLATFORM	Every institution runs its own front desk Self-signup rules, allowed email domains and community links are controlled by the institution itself, not changed by hand on request.
PLATFORM	A second, platform-wide paper trail Separate from each institution's own record, a second log covers everything anyone with platform-level access does across every institution.
COMMERCE	A full online shop, not just fee collection Individual courses and paid live-class programmes bought directly, a public marketing site with its own catalogue, cart and checkout, and proper invoices — tracked separately from ordinary fee income.
QUALITY	Checks that catch mistakes before you'd ever see them The single most common mistake found — a screen quietly showing the wrong number once an institution had enough data — now fails the build automatically the moment anyone repeats it.
QUALITY	A technical reference that can't lie about itself The document listing every function and whether it needs a login is generated from the real code, not written by hand and left to go stale.
QUALITY	Checked for accessibility, not just appearance Every core screen was tested with the same tools that check a screen reader, keyboard-only use and color-blind-safe contrast all work.
QUALITY	A dark mode across the whole product
PLATFORM	A way for other software to connect securely Outside applications can ask a signed-in user for permission to act on their behalf, with a screen to take that permission away again at any time.

Browse and join courses

WORKING

Every course the institution offers is listed in one place. Depending on how a course is set up, a learner can join it straight away, pay to unlock it, or be added directly by the institution. Tried live: a real course, joined during this check.

A learner's course list

Video, reading and document lessons

WORKING

A course can mix videos, documents, images, links and plain written pages. Every lesson — not just video — remembers exactly where a learner stopped.

An actual lesson, mid-way through

Attendance, by QR code or by hand

WORKING

A teacher opens a live session and a QR code appears that learners scan with their own phone. The code changes every 15 seconds, so a photo of it stops working within half a minute. Attendance can also be marked by hand.

A live session, with the rotating check-in code on screen

Homework: set it, mark it, hand it back

WORKING

Teachers set homework with a marking guide attached, learners submit their work online, and it comes back marked with a score and written feedback.

Real homework, handed in, marked and scored

One screen: what to do next

WORKING

Every learner gets a personal home screen built around “what should I do right now” — the course they were last on, homework due, a day streak, and a readiness score with a plain reason behind it.

A learner's own home screen

Ask a question, get a real answer

WORKING

Learners can ask a question on any course. If it goes unanswered, it can be turned into a formal support ticket with its own deadline.

A learner's own list of support tickets

Onyx Code Lab — learning to code 5 features shown below, all working

Write and run real code, in the browser

WORKING

No software to install: a learner writes code directly in the browser and sees the program's real output immediately.

The in-browser code editor, open on a real problem

Code runs safely, every time

WORKING

Every submission runs in a locked-down space that cannot reach the internet or affect anyone else's work — confirmed by deliberately trying to break out of it.

Real code, actually executed, with the real result shown back

Marked automatically, instantly

WORKING

A submission is tested against prepared cases — some shown, some hidden — with partial credit and instant feedback on exactly what happened.

The same problem, graded the instant it was run

A library of practice problems

WORKING

Problems are organised by difficulty and topic, with hints available for a small cost and worked solutions that unlock once a learner has earned them.

The practice bank, filterable by difficulty and topic

Real, multi-file coding projects

● WORKING

Beyond a single problem, a learner can start a full project with a save-point button, and their teacher can open it and leave comments.

A learner's own project workspace

Onyx Assess — tests and exams

4 features shown below, all working

Scheduled, timed online tests

WORKING

Tests are timed by the server, not the learner's device, and drawn from randomised question banks so the class doesn't all sit an identical paper.

A learner's list of tests: open, closed, or being marked

Exam integrity, watched and reviewed

WORKING

For exams that need it, the camera and screen are monitored and anything unusual is flagged for a real person to review. A flag is evidence, never an automatic fail.

The live integrity console a teacher watches during an exam

Marking: automatic where possible, by hand where it matters

WORKING

Multiple-choice questions are marked instantly. Written answers are marked by a teacher against a guide, with an optional second check before results go out.

A teacher's marking queue, with real papers waiting

Results, the moment they're released

WORKING

Once released, a learner sees their score and grade in one place, alongside how the class did overall — invisible to them until that moment.

A learner's own results page

Live coding contests

● WORKING

The institution can run a timed coding contest with a leaderboard and team entry, judged automatically by the same safe system used for everyday practice.

A live contest, entered and being judged

Practice job interviews

● WORKING

A mock interview can be booked, scored against clear criteria, and optionally recorded with consent. The interviewer's private notes are never shown to the learner.

A learner's own interview screen

The same feature, employer side

Certificates anyone can verify

● WORKING

A learner who completes a course gets a certificate with a unique code. Anyone can look it up on a public page, no account needed, and see if it's genuine.

The certificate register — one freshly issued

That certificate's public page, no login

Jobs, applications and employers

● WORKING

Employers post roles, learners apply, and the placement office manages it all. Each employer only ever sees their own applicants — never another company's.

A learner's own job applications

The same role, employer side

A profile built for employers

● WORKING

Every learner gets a shareable profile and a one-click resume builder that assembles a PDF from their actual record, so it can never go stale.

A learner's own profile

The resume it builds, from that record

Onyx Campus — running the institution

5 features shown below, all working

Programmes, terms and timetables

WORKING

The institution's academic structure is set up and published from one place, with a double-booked room or teacher caught automatically.

A programme, its term and its cohort, set up in the console

Exams, start to finish

WORKING

The examinations office schedules an exam, enters and checks marks, and publishes results, with scripts downloadable as PDFs.

The examinations office's own schedule, mid-term

Fees, payments and receipts

WORKING

The institution can set fee structures, send invoices, take payments online, and see who still owes money, with course and fee income kept separate.

The finance console, with real payments recorded

Parents, with the learner's own permission

WORKING

A guardian can sign in to see attendance, results and fees — only once invited, and only for what the learner has agreed to share.

What a linked guardian actually sees

Secure by design

WORKING

Every institution's data is kept completely separate from every other's, every role sees only what it's allowed to, and every action is permanently logged. Checked with 140 attempts to see another institution's data — none got through.

Exactly what each role can and can't do

The permanent record of who did what, and when

Extra features implemented

The three above with a screen worth seeing — the rest are in the table on page 3

A whole extra layer above your institution

WORKING

A separate control centre that can create, pause or remove an entire institution, and run one on a customer's behalf without them logging in. Seven institutions run on it today.

Every institution on the platform, at a glance

Looking at one institution from that control centre

Every institution runs its own front desk

WORKING

Self-signup rules, allowed email domains and community links are controlled by the institution itself, not changed by hand on request.

An institution's own self-service settings

A second, platform-wide paper trail

WORKING

Separate from each institution's own record, a second log covers everything anyone with platform-level access does across every institution.

The platform-wide record, distinct from any one institution's own

Bottom line. Every feature in your proposal is built and was shown working, live, while putting this report together — plus nine more nobody asked for.

Onyx LMS · a plain-language walkthrough of the proposal, prepared for the client · every screenshot taken live against onyx-lms-v2.vercel.app
